

**City of Charleston under approaching storm, seen from the
ocean, through harbor entrance**

Charleston Harbor, South Carolina

The city of Charleston is built on a peninsula, much of which was wetland, formed at the junction of two rivers. The land is subsiding, largely due to the removal of groundwater, and the water in the harbor is rising: 12 inches in the last 100 years, a rate that is predicted to increase exponentially. Already, residents must look at the tide tables to plan their daily schedules.

Morning beachgoers

Myrtle Beach, South Carolina, USA

Recreation is a major attraction of coastlines, with its own infrastructure and pollution problems. Large hotels and resort complexes are built, replacing the dunes and mangroves which protected the shore, pollution from these populations fouls the water, poisons the ocean life, and promotes algae blooms. Roads and parking lots are built replacing the impermeable earth with asphalt and concrete, and allowing toxic runoff.

St Helena Sound wetlands

St Helena Sound

These wetlands were flooded due to tremendous rains from Hurricane Joaquin. Wetlands provide a vital buffer for storms, absorbing extreme rain events and cushioning the mainland from storm surges.

**Charleston peninsula showing confluence of three rivers: Ashley,
Cooper, and Wando**

Charleston, SC

I had often in my childhood seen illustrations of the two rivers forming the peninsula, but never saw it as a photograph. from 3500 feet. Fortunately, we had several rare, clear days (in spite of the perpetual brown haze in the sky). This shot required three attempts, the first two being not quite high enough to get the sense of the rivers coming together.
